

# Krish Nilesh Pinto

Full-Stack & Infrastructure Engineer

+91 93248 10880 | [krishpinto123@gmail.com](mailto:krishpinto123@gmail.com) | [linkedin.com/in/krish-pinto](https://linkedin.com/in/krish-pinto) | [github.com/krishpinto](https://github.com/krishpinto) | [krishpinto.co.in](https://krishpinto.co.in)

Final-year Computer Engineering student who builds systems end to end. A live email platform with a paying client, an open-source Rust memory engine, and a Kubernetes-native CLI with 1,900+ npm downloads. Most interested in what sits underneath: delivery pipelines, idempotency and retrieval.

## EXPERIENCE

**Infinity Pool Finnotech** · Final-year Major Project Jul 2026 – Present

- Building multi-agent workflow systems for a fintech firm (resume screening, interview, HR and marketing agents), including the orchestration and evaluation layer around those LLM pipelines.

**SVIK Infotech** · Software Development Intern Sep 2025 – Jul 2026

- First engineer on an enterprise project-management platform (React, .NET Core, PostgreSQL) in the light-ERP space. Built the core system end to end as a multi-tenant product intended for external sale, through to production supporting 3+ development teams.
- Built backend APIs for context-aware project monitoring, cutting average query response time ~40% through query optimisation and indexing.

**BOBST India Pvt Ltd** · Software Engineering Intern Jul 2025 – Aug 2025

- Built an enterprise issue-management system on the company's mandated Microsoft stack (Power Apps, Power Automate, Power BI) across a 500+ employee branch, cutting manual follow-ups ~60% and reporting overhead ~4 hrs/week.
- Ran requirements gathering department by department, mapping how each function handled escalations before designing around the existing process.

**FCRIT** · Research Intern, Predictive Maintenance Systems Sep 2024 – Present

- Built a predictive-maintenance system for rotary machinery, combining FFT vibration-spectrum analysis with a time-series model to detect early bearing wear in pumps, plus a dashboard ingesting live sensor data from the digital-twin lab. Co-authoring a paper on the methodology.

## PROJECTS

**LetterStack** · email campaign platform · 2 organisations live [letterstack.site](https://letterstack.site)

- Multi-tenant campaign platform built end to end: block-based canvas editor compiling to email-safe HTML, sent via Amazon SES. Live with CIBA, a Mumbai organisation, as a paying client, and TUSK, a D2C oral-care brand, onboarded since.
- Architected the send pipeline: a trigger endpoint freezes an HTML snapshot and fans batches through Upstash QStash to signature-verified workers, kept idempotent under retry by pending-row filtering and a per-campaign unique constraint.
- Designed the reputation loop: an SES configuration set publishes delivery/bounce/open/click events through SNS to a webhook that auto-populates a global suppression list, checked on every future send.

**Grasp** · local-first memory engine for AI agents · Rust, open source [GitHub](#)

- Rust memory layer consolidating AI assistant transcripts into a queryable store: parsing, chunking, secret redaction and indexing into SQLite, with Markdown kept as the durable source of truth.
- Hybrid retrieval fusing SQLite FTSS BM25 with cosine similarity over on-device MiniLM embeddings (candle, no API) via reciprocal rank fusion, exposed through a custom MCP server.

**Artemis CLI** · local Kubernetes dev-stack provisioner · 1,900+ npm downloads [GitHub](#) [npm](#)

- One-command local dev environment: a Kubernetes-native CLI (Ink/React TUI) provisioning an 8-service stack (PostgreSQL, Redis, MongoDB, MySQL, MinIO, Grafana, Prometheus, RabbitMQ) through the Kubernetes API.
- Parallel image pulls bring the stack up in the time of the slowest one; re-deploys are idempotent and instant against cached images. Shipped Mission Control, a Next.js dashboard with health, a SQL explorer and a Redis browser.

**Sentinel** · on-device Android scam detection · 1st place, Hack4Innovation [App](#) [Launcher](#)

- Android launcher with call interception feeding an on-device scoring engine over call, SMS and URL signals, with no cloud dependency. React Native app with a native Kotlin launcher; built and won in 36 hours.

## SKILLS

**Languages** TypeScript, JavaScript, Rust, Python, C++, SQL

**Backend & Data** Node.js, Next.js, .NET Core, PostgreSQL, SQLite, Redis, Drizzle ORM, REST APIs

**Infrastructure** Kubernetes, Docker, AWS (EC2, S3, SES, SNS), Vercel, queues, background workers

**AI** Embeddings, hybrid retrieval, RAG pipelines, agent orchestration, LangChain / LangGraph, MCP

## EDUCATION

**B.Tech Computer Engineering**, Fr. Conceicao Rodrigues Institute of Technology, Mumbai University · 2023 – 2027 · CGPI 8.78 / 10, SGPI 10 / 10 most recent semester
